

DevOps Career Guide

Personalized Roadmap Based on Your Skills

1. Recommended Job Titles

Based on your AWS Associate Certificate, RHCSA, and 8 months of web hosting experience:

Good Fit Right Now:

- Junior Cloud Administrator
- Junior Linux System Administrator
- Junior DevOps Engineer
- Cloud Support Engineer
- Web Hosting Support Technician
- IT Infrastructure Support Specialist

Stretch Roles (with a bit more experience):

- Cloud Operations Engineer
- Systems Administrator
- Junior Site Reliability Engineer (SRE)

Tips: Your combo of AWS + RHCSA is solid for any cloud/Linux hybrid role. With 8 months experience, target Junior or Associate level titles. Web hosting experience is a plus for roles involving Linux servers and cloud deployments.

2. Junior DevOps Roadmap

You Already Have: AWS Associate, RHCSA (Linux), Web hosting experience

Learn Next (Priority Order):

1. Version Control

- Git & GitHub (essential, learn this first)

2. Containerization

- Docker (very important for DevOps)
- Kubernetes basics (bonus)

3. CI/CD Pipelines

- Jenkins or GitHub Actions
- Basic pipeline setup

4. Infrastructure as Code (IaC)

- Terraform (most in-demand)
- AWS CloudFormation (you're already in AWS ecosystem)

5. Scripting

- Bash scripting (builds on your Linux skills)
- Python basics (very common in DevOps)

6. Monitoring & Logging

- Grafana + Prometheus basics
- AWS CloudWatch

Recommended Next Certifications:

- AWS DevOps Engineer – Professional (natural next step)
- Docker Certified Associate
- Terraform Associate (HashiCorp)

Realistic Timeline: With focused effort, you could be job-ready for Junior DevOps in 4–6 months. Your AWS + RHCSA foundation is stronger than most beginners.

3. Bash Scripting Tips

Why Bash Matters in DevOps:

- Automating repetitive server tasks
- Writing deployment scripts
- Log monitoring & cleanup
- Cron jobs scheduling

You Don't Need to Master It — Just Learn the Basics:

- Variables & echo (print output)
- If/else conditions
- Loops (for, while)
- Functions
- Reading files & user input
- Simple automation scripts

Best Free Resources:

- Ryan's Bash Scripting Tutorial (ryantutorials.net) — very beginner friendly
- Linux Command (linuxcommand.org)
- TechWorld with Nana on YouTube — practical DevOps-focused

Practice Tip: Open your terminal daily and write small scripts like: 'Script to check disk usage and send alert' or 'Script to auto-backup a folder'. Real practice beats reading every time.

4. Can You Target Junior DevOps Without Bash?

Yes you can! Most Junior DevOps job descriptions list Bash as 'nice to have' not always 'must have' — especially if you're strong in other areas.

You Can Compensate With:

- Python scripting instead of Bash — actually more valued in modern DevOps
- Strong Docker & Kubernetes knowledge
- Solid Terraform skills
- Good CI/CD hands-on experience

Basic Python for DevOps — Just Learn:

- File handling
- OS module (interacting with system)
- Subprocess module
- Simple automation scripts

Bottom Line: Bash is helpful but not a dealbreaker. Python is a stronger alternative. Your AWS + RHCSA + Git + Docker + Terraform combo can absolutely land you a Junior DevOps role.

You're closer to your Junior DevOps goal than you think. Focus on Docker and Terraform next — those will make the biggest difference!
